ShowName: Cisco CCNA (200-301)

Topic: 2.0 Network Access

EpisodeName: Cisco Wireless WLAN Components

Description: In this episode, you will learn about the different components connected to the WLC. You will recognize how the devices are physically connected and what type of connections (Logical) are needed in the wireless infrastructure.

Cisco Wireless WLAN Components

2.7 Describe physical infrastructure connections of WLAN components (AP, WLC, access/trunk ports, and LAG)

- AP (Access Point)
- WLC (Wireless LAN Controllers)
- Access/Trunk Ports
 - configure trunks between Switch and WLC
 - configure access points between Switch and APs

LAG (Link Aggregation) to connect to network (for users)

- Aggregation of multiple links to provide more bandwidth and to eliminate single link failure
- Only one LAG group per WLC (only one WLC to one Switch)
- 2504 or 3504 can bundle up to 4 ports
- 5508 and later can bundle up to 8
- with the WLC does not use PAgP or LACP but be hard set for LAG
- after setting it, the WLC must be rebooted
